Laravel Practical Task

1. **There are a 3 models. User, Country, and Company.**
   a. **Company is related to just one Country**
   b. **User can be associated with a few Companies**
   c. **Company can be associated with a few users.**

   Create relationships that will retrieve all users who are associated with companies in a given country. Also display all company names and the users associated with companies and dates when a user was associated with a company.

   All we have is a country name:

   eg: $country = 'India';

   Need to create a webpage in which the above mentioned details can be displayed. (Include a Country dropdown to Filter the data according to selected country).
   Also create an GET API for same.

2. **Create a feature that will handle a simple PDF file upload.**

   a. **If the file is not PDF, return 415 error.**
   b. **If the file doesn't contain the word "Proposal", just ignore the PDF and return 422 error.**
   c. **If it's a PDF file, check if we already have the file with the same name and size (the `name` and `size` columns in our DB table). If we have it, we'll need to update the existing one instead of creating a new record for the file.**
   d. **Show all listing of Uploaded Files.**

   Need to create webpage(s) in which the above functionality can be performed.
